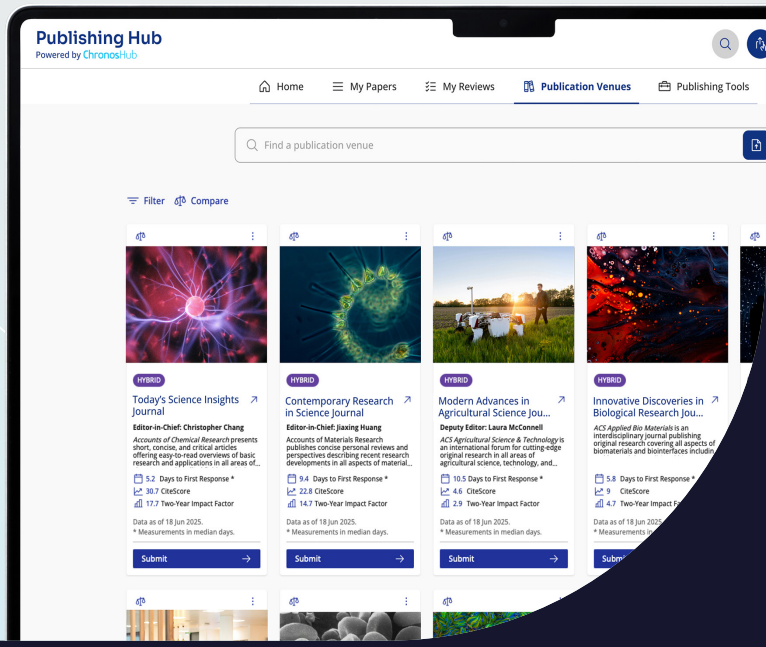
ChronosHub

Fix it at the front door

Reclaim control over the workflows that define how authors publish with you. ChronosHub Runway automates checks, applies business rules, and integrates tools upfront. Submissions arrive readier for editorial assessment and peer review.



Give editors time back

More room for editorial judgement. Less effort spent on problems tech should catch..

Keep authors returning

A submission experience that's refreshingly modern and genuinely helpful.

Make investments count

Put tools and expertise earlier, where they impact quality more effectively.

Built on a brilliant foundation

Research advances through openness. Publishing technology should too. ChronosHub is the connective infrastructure between the systems, services, and workflows you depend on.

This gives you:

- **Freedom to choose the tools you want**
  Test, swap, and adopt tools without long development cycles.
- **Stability as well as progress**
  Your PRS and other core systems stay put as you evolve workflows.
- **Unified UX across your stack**
  One consistent author journey regardless of the systems in use.
- **Insights your PRS was sitting on**
  An accessible record of author behavior and journal performance.

What Runway includes

- **Pre-submissions**
  Start the author relationship off strong with a sleek publications catalogue and manuscript readiness checks.
- **Submissions**
  Collect submissions through a one-page form that extracts and validates metadata as it goes. Authors save time. Editors get submissions they can work with, not corrections to chase.
- **Manuscript tracking**
  Help authors and reviewers follow their manuscripts' real-time progress via a kanban-style board. Statuses are pulled automatically from your PRS.
- **In the works: Editor triage**
  Arm your editors with tools to manage submissions at scale. Includes workload dashboards and easy transfer options.

> ChronosHub delivers a consistent, intuitive author experience while letting us plug and play new tools, experiment more, and work flexibly on the back end.
