

Upgrade the form, keep your PRS

Gives authors a fast, validated submission form. Editors get cleaner metadata from the start. And submissions transfer directly into your peer review system, no migration necessary.

Save authors time

Fields populate automatically with information extracted from the manuscript.

Free editors from rework

Metadata is verified against trusted identifiers, so editors skip avoidable fixes.

Take control of your setup

Configure the submission experience to match each journal's needs, without support tickets.

How it works

Author uploads their manuscript

ChronosHub's AI extracts its metadata and pre-fills fields including title, author details, and abstract.

ChronosHub verifies details

We check authors' affiliations and funder policy compliance against multiple databases.

Missing details are flagged

The author is asked to make corrections manually. They can also add editor and reviewer preferences.

The submission is sent to your PRS

Once the author presses 'Submit', the submission, manuscript, and additional files transfer across in the correct format.

Key features

- ✓ **Multiple submission types supported**
Original submissions, revisions, resubmissions, transfers, and invited articles all follow the same route.
- ✓ **Author identity validation**
Author details are verified against identifiers including ROR and Ringgold, so potential issues get picked up earlier.
- ✓ **Sanctioned country screening**
A submission that references a sanctioned country is blocked rather than accepted and queued for someone to look at.
- ✓ **Always in-sync journal config**
Journal settings come straight from your PRS, so there's nothing to set up twice. New journals can go live in days.

ChronosHub has helped us get submissions down to six minutes in many cases. And we're getting better metadata feeds into our peer review than ever before.

—David Haber, Publishing Operations Director, American Society for Microbiology
